“ICEDQ Usage experience at a leading health insurance company”

Pros: ICEDQ software is a great data testing automation tool which helped us in automating the comparison of data for both homogeneous and heterogeneous sources containing billions of rows for 100% test coverage. We use almost all relational databases and most importantly SAS for which we do not have proper automation framework before using ICEDQ. But with the support of all connectors for relational database and SAS dataset, we were able to complete our project milestones efficiently with high quality. Efficient mismatch report helped business and development team in debugging issues faster. Also, most importantly, customer support is always good. Initial implementation and adoption is very quick and the customer support team always resolved all our critical issues on time.

Cons: SAS support - Currently this tool supports SAS files from a network drive location. User had to create multiple connections for each location. We would like to see this tool has support for SAS JDBC/ODBC. Other than that no major issues. Again, customer support always good and provide alternative solutions
